

Tuckean Site 1 Water Quality – July 2017

Data logger located at Bagotville in the Broadwater downstream from Bagotville Barrage

Notes

*The data logger was giving some inconsistent results for electrical conductivity, pH and water temperature during June and July. The data logger was found to be faulty and sent for repair on 22 June. The logger was reinstalled on 12 July. Due to the unreliability, EC, pH and water temp have not been reported for Site 1 prior to 12 July.

- Manual sampling records taken above the Bagotville Barrage (corresponding with the logger at Site 2) will provide indicative results for EC, pH and water temperature at Site 1 throughout June and July.
- DO results have been obtained by manual sampling at Site 2 throughout July.
